
Adverse weather conditions

De-icing & Anti-icing operations

To the attention of **FLIGHT CREWS**

Effective de-icing management relies on appropriate planning and timely execution of the process which determines the overall throughput of de-icing pads. It is highly recommended that all flight crews are trained to follow both pre- and post- de-icing procedures as per aircraft manufacturer manual and company procedures in order to perform flight safely and efficiently as well as consequently minimize the occupancy time of de-icing pads. On-time aircraft readiness might significantly improve overall adherence to CTOT.
